GROWTH CHARTS
WITH REFERENCE PERCENTILES
FOR GIRLS
2 TO 18 YEARS OF AGE

Stature for Age
Weight for Age
Weight for Stature

NAME _____ **RECORD #** _____

DATE OF BIRTH _____

Date of Measurement	Age Years	Age Months	Stature	Weight		

These charts to record the growth of the individual child were constructed by the National Center for Health Statistics in collaboration with the Center for Disease Control. The charts are based on data from national probability samples representative of girls in the general U.S. population. Their use will direct attention to unusual body size which may be due to disease or poor nutrition.

Measuring: Take all measurements with the child in minimal indoor clothing and without shoes. Measure stature with the child standing. Use a beam balance to measure weight.

Recording: First take all measurements and record them on this front page. Then graph each measurement on the appropriate chart. Find the child's age on the horizontal scale; then follow a vertical line from that point to the horizontal level of the child's measurement (stature or weight). Where the two lines intersect, make a cross mark with a pencil. In graphing weight for stature, place the cross mark directly above the child's stature at the horizontal level of her weight. When the child is measured again, join the new set of cross marks to the previous set by straight lines.

Do not use the weight for stature chart for girls who have begun to develop secondary sex characteristics.

Interpreting: Many factors influence growth. Therefore, growth data cannot be used alone to diagnose disease, but they do allow you to identify some unusual children.

Each chart contains a series of curved lines numbered to show selected percentiles. These refer to the rank of a measure in a group of 100. Thus, when a cross mark is on the 95th percentile line of weight for age it means that only five children among 100 of the corresponding age and sex have weights greater than that recorded.

Inspect the set of cross marks you have just made. If any are particularly high or low (for example, above the 95th percentile or below the 5th percentile), you may want to refer the child to a physician. *Compare* the most recent set of cross marks with earlier sets for the same child. If she has changed rapidly in percentile levels, you may want to refer her to a physician. Rapid changes are less likely to be significant when they occur within the range from the 25th to the 75th percentile.

In normal teenagers, the age at onset of puberty varies. Rises occur in percentile levels if puberty is early, and these levels fall if puberty is late.
